

Figure. The distribution of cumulative COVID-19 cases in Ontario by acquisition type over time. Other_Cases include cases in community, shelter, jails and those whose travel history information is unknown. Data sources: iPHIS; OLIS.

Methods:

We calculated the proportion of cases that were travel-related using the iPHIS data. We estimated the proportion of positive cases in LTC facilities using the OLIS testing data.

Based on the OLIS testing data, as of Apr 27th, 23.1% of all individuals who tested positive in Ontario live in a LTC facility (**Figure**). This estimate is similar to those reported according to the iPHIS data ($3273/15381 = 21.3\%$ as of Apr 27th; source: Public Health Ontario. Epidemiologic Summary. COVID-19 in Ontario: Jan15-Apr27, 2020).
